

08-28-25_weekly-update

Cappy Pugliese

8/25 - 8/29

future todos from last semester:

- check to make sure script ran properly and all samples generated an indexed file (.tbi - I'm assuming this is an index file, although I'm not actually sure)
- trouble shoot if any of the samples didn't run properly
- merge everything back into one folder if things do run properly
- can delete the test Pd_03 run from my own directory if run2 works out
- make the script for the next GVCf process

This week

Wednesday 8/27

- filled out my master's plan of study form
- sent it over to Andrius to sign and need the rest of the committee to sign it as well

Thursday 8/28

- picking up from where I left off last semester
- trying to figure out why script failed last time it ran
 - looks like it might have run out of memory, but more so within the tmp directory?
 - am rerunning it again with less bams files running at the same time (2 in parallel instead of 5), hopefully this solves the issue?
 - * it seems to be running fine so far
